

SPECIFICATIONS FOR GRAVESTONES IN JEFFERSONTON BAPTIST CHURCH CEMETERY

Grave markers will not be wider than 36" for a single grave and 78" for a double grave. All markers must remain within the bounds of the actual grave which is 3' by 7'. No marker shall exceed a height of 4' for a solid stone and 6' for a spire. Any mausoleum must be given prior authorization. Any inspection must be done by a member of the Cemetery Committee during the foundation preparation, after the foundation hole is dug and before the stone is set.

For an upright stone:

The foundation of the stone must be dug to 3' below the ground level and the exact circumference of the stone. The foundation consists of poured concrete mixed with crushed rock and gravel and is not allowed to be set before the stone is placed.

No attachment is required between the stone and the foundation.

For a flush stone:

Flush stones are usually 4" in height. The foundation is dug to the dimensions of the stone and two feet deep. It is then filled to within 5" of the ground surface with dry Sakrete. An inch of sand is placed on top of the Sakrete, and the stone is laid immediately bringing it to ground level.
